----------------------------------	----

I. Introduction

In this report, we explore how the agile scrum methodology can be utilized to create a tailored enterprise web system through a series of iterative releases referred to as sprints. Our methodology follows the agile framework carefully, starting with planning and organizing, which entails using a product backlog to prioritize features. Each sprint is made up of a sprint backlog and a burn-down chart, which the team must discuss during weekly meetings. To ensure that each team member contributes effectively to the project, they must each take on a role that plays to their strengths and skill set. Last but not least, our duty entails developing a safe web-based role-oriented system to record improvement ideas from a top university's staff. We shall go into more detail about the project's many criteria and roles later on in this report.

II. Evaluation of product and process

1. Evaluation of Product

a) Final Product Images

Login:

The login screen allows admin to login and staff, assurance manager, assurance coordinator can login using the account admin created for them. They will enter the correct username and password in the box and click the login button, if the information they have just entered is not correct, there will be a message.

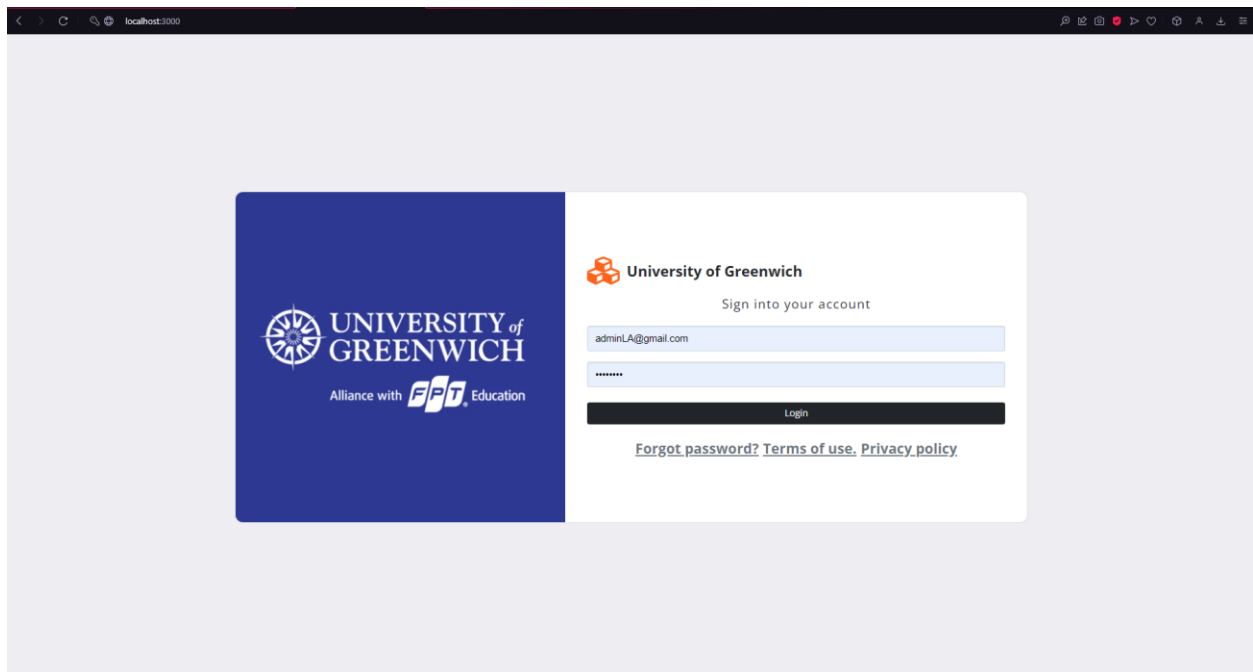

Figure 1: Login page

Admin:

The admin screen has a taskbar on the left that shows the function quality assurance manager, quality assurance coordinator, quality staff, and event. The taskbar above displays the username, the user can click on it to select change password or log out.

Figure 2: Admin page

This is the admin's quality assurance manager screen, admin can add new users, search for user information by username, edit and delete user information. The quality assurance coordinator and quality staff pages are similar.

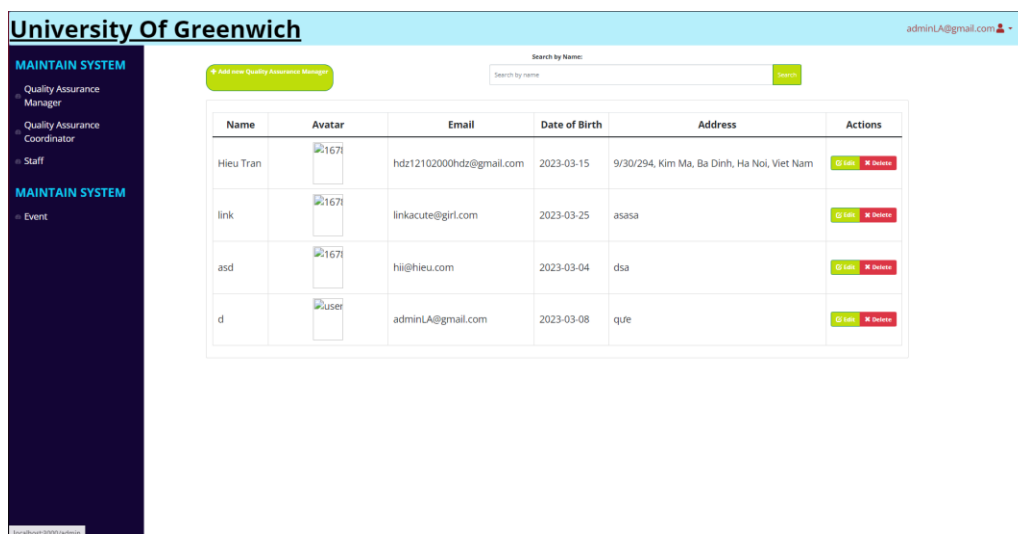

Figure 3: Quality Assurance Manager page

This is the admin's event screen, admin can search event information by name, edit event date information.

b) Evaluative comments on the product

Pros:

- To ensure that only authorized users may access particular functionalities, the system supports role-based access control.
- Users can interact with the system and submit their ideas using its user-friendly interface while also viewing other users' entries.
- The tracking of statistics offered by the system enables Quality Assurance Managers to keep track of developments and pinpoint areas in need of improvement.
- The program enables the download of data and files in the CSV and ZIP formats, respectively.

Cons:

- The collecting and storage of user data may raise privacy issues that the system will need to solve.
- To stop unwanted access to sensitive data, the system could need additional security measures.

Further improvements:

- The system could allow for the integration of machine learning algorithms to automate the categorization and prioritization of idea submissions.

- The system should have feedback mechanism to enable users to provide suggestions for system improvement.

2. Evaluation of process

For this project, the Agile technique was our first choice because it allowed us to design and execute a top-notch website. In order to accomplish this, we chose Scrum, a crucial framework for managing large projects that is part of the Agile approach.

a) Product Backlog

Story ID	As a/an	Story	priority	added in sprint	story point (10/10)
1		I want to login to my account	Must have	1	10
2		I want to see the lists of Most Popular Ideas, Most Viewed Ideas, Latest Ideas and Latest Comments	Must have	2	7
3		I want to add add additional categories, delete unused categories	Must have	2	7
4		I want to view statistics of number of ideas per department/year	Should have	3	8
5		I want to view numbers of contributors (staffs with idea submission) per departments	Should have	3	8
6		I want to download all idea data after the final closure date in CSV file	Should have	3	8
7	Quality Assurance Manager	I want to download all uploaded documents in ZIP format	Should have	3	8
8		I want to login to my account	Must have	1	10
9		I want to receive email notifications for new submissions from staff	Should have	2	7
10	Quality Assurance Coordinator	I want to see the lists of Most Popular Ideas, Most Viewed Ideas, Latest Ideas and Latest Comments	Must have	3	10
11		I want to login to my account	Must have	1	10
12		I want to submit 1 or many documents until the first closure date	Must have	3	10
13		I want to see all submitted ideas	Must have	3	10
14		I want to read comment for any other ideas	Must have	3	10
15		I want to give comment for any other ideas until the final closure date	Must have	3	10
16		I want to give Like or Dislike for any idea.	Must have	3	10
17		I want to receive email notification	Should have	3	10
18	Staff	I want to see the lists of Most Popular Ideas, Most Viewed Ideas, Latest Ideas and Latest Comments	Must have	3	10
19		I want to login to my account	Must have	1	10
20		I want to create new accounts for each role	Must have	1	10
21		I want to set, edit first closure date and final closure date	Must have	3	10
22		I want to maintain system data	Must have	3	10
23	Admin	I want to See the lists of Most Popular Ideas, Most Viewed Ideas, Latest Ideas and Latest Comments	Must have	3	10

Figure 15: Product backlog

In accordance with our Agile methodology, we selected 23 user functions after assessing and examining the system. Three priority levels were assigned to each of these tasks: "Should have," "Must have," and "Could have been." The "Must Have" functions, which are highlighted in red, are vital to the system's success. The system might still function without the "Should have" characteristics, which are denoted in yellow but are not required.

b) Sprint Backlog & Burndown Chart

SPRINT 1											
ID	User's story	Tasks	Responsible	Original Estimate (hours)	Day1 (22/02)	Day2 (23/02)	Day3 (24/02)	Day4 (25/02)	Day5 (26/02)	Day6 (27/2)	Status

c) Meeting minutes

Meeting 1

Meeting subject: Assign roles group member

Meeting date: 22/02/2023

Meeting form: Online meeting. Tool: Google Meet

Meeting duration: 1 hour 15 minutes

Name	Role	Status
Nguyen Gia Nam	Scum master, Project manage	Attented
Nguyen Ha Nguyen	Backend developer	Attented
Tran Anh Tu	Frontend developer	Attented
Duong Tien Thanh	Tester	Attented
Pham Quang Huy	Database designer	Attented
Tran Trung Hieu	Frontend developer	Attented

Figure 22: Meeting 1

Topics	
Training project for team (router, controller, OOP) Refactor project structure, apply front end, config ip for project	
Analyze system requirements, design database, use case diagram, flowchart	
Set up environment, create database	
Apply framework build front end and apply with backend Examine and improve the team's code's login, logout, and registration features.	
Learn about react-js, node-js, mongodb	
Conclusions	
Learning new technologies	
Tasks	
Code Admin page and Login page, create faculty page	
Design and create table users and groups	
Apply front end to work with backend	
Test login and admin	
Deadline	28/02/2023

Figure 23: Meeting 1

Meeting 2

Meeting subject: Design system interface and coding important function

Meeting date: 01/03/2023

Meeting form: Online meeting. Tool: Google Meet

Meeting duration: 1 hour 10 minutes

Name	Role	Status
Nguyen Gia Nam	Scum master, Project manage	Attented
Nguyen Ha Nguyen	Backend developer	Attented
Tran Anh Tu	Business analyst	Attented
Duong Tien Thanh	Tester	Attented
Pham Quang Huy	Database designer	Attented
Tran Trung Hieu	Frontend developer	Attented

Figure 24: Meeting 2

Topics	
Build Front-end for Admin	
Get data from back-end	
Design front-end	
Get upload csv, zip files	
Fix mongodb create table	
Demo code reactJS	
Support member environment	
Conclusion	
Design web enterprise interface	
Tasks	
Code Student page, admin page	
Fix bug	
Create database	
Testing	
Deadline	07/03/2023

Figure 25: Meeting 2

Meeting 3

Meeting subject: Deploy on website

Meeting date: 20/03/2023

Meeting form: Online meeting. Tool: Google Meet

Meeting duration: 1 hour 30 minutes

Name	Role	Status
Nguyen Gia Nam	Scum master, Project manage	Attented
Nguyen Ha Nguyen	Backend developer	Attented
Tran Anh Tu	Business analyst	Attented
Duong Tien Thanh	Tester	Attented
Pham Quang Huy	Database designer	Attented
Tran Trung Hieu	Frontend developer	Attented

Figure 26: Meeting 3

Topics	
Build Front-end for QA	
Get data from back-end	
Clean code and fix bug	
Fix upload csv, zip files	
Deploy on web Support member environment	
Conclusions	
Review work results Discuss which functions need to fix in next weeks Completed all task in sprint	
Tasks	
Code Student page, admin page	
Fix bug	
Create database	
Testing	
Deadline	28/02/2023

Figure 27: Meeting 3

d) Requirement Analysis

Our project involved designing a secure web-based role-oriented system for soliciting improvement suggestions from the staff members of a major university. The system comprises four distinct roles: Admin, Staff, Quality Assurance Manager, and Quality Assurance Coordinator. Each role has specific responsibilities outlined as follows:

- Admin: responsible for maintaining all system data and setting the closure date for submitting ideas.
- Staff: responsible for submitting their improvement ideas.
- Quality Assurance Manager: responsible for overseeing the entire process.
- Quality Assurance Coordinator: responsible for managing the process within their department and encouraging staff to participate actively.

e) Evaluative comments on the Scrum process: Pros, Cons and Further improvements

We evaluated the Scrum process and came up with the following list of its benefits, drawbacks, and potential areas for development:

Pros:

- **Flexibility:** Scrum approach enables adaptability to changes in project requirements, making it simpler to deliver products that satisfy customers' needs.
- **Transparency:** The daily Scrum meetings give team members a forum for free communication and transparency, which improves teamwork and morale.
- **Incremental delivery:** Scrum's iterative and incremental delivery approach makes sure that the product is supplied in brief but valuable bursts, encouraging early feedback and speedier value delivery.

Cons:

- **Lack of documentation:** Scrum approach downplays the importance of thorough documentation, which can make it difficult to grasp and clarify project requirements.
- **Dependence on the team:** The Scrum process relies largely on the team's dedication and willingness to follow the methodology, which might be difficult in particular circumstances.
- **Time-consuming:** Regular meetings and reviews are a part of the Scrum process, which can consume a lot of time and resources.

Further Improvements:

- **Better communication:** The Scrum process may be made more effective by enhancing communication channels and making sure that all stakeholders are appropriately informed about the project's status.
- **Emphasis on documentation:** Despite the Scrum methodology's preference for working software over documentation, making sure that it is thorough and current can help avoid misunderstandings and minimize errors.
- **Clearer roles and responsibilities:** The teamwork and participation of each team member can be enhanced by clearly outlining their roles and duties, which will result in a more effective Scrum process.

III. Evaluation of team

FACTOR	WEIGHT	Nguyễn Hà Nguyên	Phạm Quang Huy	Nguyễn Gia Nam	Dương Tiến Thành	Trần Anh Tú	Trần Trung Hiếu
On time	6	8	9	8	9	9	9

Knowledge	6	8	8	10	8	8	8
Communication	2	8	8	9	8	8	8
Friendly	5	10	8	9	9	9	8
TOTAL	43	8.6	8.6	8.6	8.6	8.6	8.6

Table 1: Evaluation of team

Nguyễn Hà Nguyên

Nguyen Ha Nguyen, the back-end developer, played a vital role in developing the project's server-side components. Their contributions to the project ensured that the system was reliable, secure, and scalable. His dedication to writing clean, efficient code helped to reduce the overall development time and ensured that the system was maintainable in the long run.

Phạm Quang Huy

Pham Quang Huy, the database developer, was responsible for designing and implementing the system's database architecture. Their expertise in database management systems helped to ensure that the system was efficient, reliable, and scalable. His contributions were instrumental in ensuring that the system could handle large volumes of data while maintaining optimal performance.

Nguyễn Gia Nam

Nguyen Gia Nam, the team leader, played a critical role in keeping the project on track and ensuring that all team members were working towards the same goals. Their communication skills were essential in keeping everyone informed and engaged throughout the project's life cycle. His ability to identify and resolve issues in a timely manner helped to ensure that the project was delivered on time and within budget.

Dương Tiến Thành

Duong Tien Thanh, the tester, was responsible for ensuring the system's quality by testing and identifying any issues or bugs. His attention to detail and dedication to delivering a high-quality product were essential in ensuring that the final product was reliable and met the client's requirements.

Trần Anh Tú

Tran Anh Tu - the front-end developers, were responsible for creating an engaging and intuitive user experience. Their ability to create visually appealing designs and develop responsive interfaces helped to ensure that the system was easy to use and accessible across different devices. His contributions were crucial in creating a final product that met the client's expectations and provided an enjoyable user experience.

Trần Trung Hiếu

I am front-end developer too, I work with Tran Anh Tu together. The project's success depended heavily on my commitment and excellent work, and I hope to keep developing my abilities and adaptability in future assignments.

Overall, each team member's contributions were instrumental in ensuring the project's success, and their dedication and expertise were essential in delivering a high-quality product. Working in an agile process, the team was able to collaborate effectively, adapt to changes, and deliver a product that met the client's requirements.

IV. Self-evaluation

1. My contributions

Assigned position in the team: Front end developer.

Add new assurance manager, assurance coordinator, staff page

This screen is where assurance managers, assurance coordinators, and staff can be added new information by admin.

The wireframe shows a user management interface. On the left, a sidebar contains a user profile section with a red circular avatar placeholder and the text 'Account username'. Below this are four black buttons with white text: 'Quality Assurance Manager', 'Quality Assurance Coordinator', 'Staff', and 'Event'. The main content area is titled 'Add new' and contains a form with the following fields: a circular 'Avatar' placeholder, 'Full name' and 'Email' input fields, a 'Date of birth' input field, a 'Choose file' button, and a large 'Address' text area. A 'Save' button is located at the bottom right of the form.

Figure 37: Wireframe Add new user

Event page

Admins can create a new event on the quality event page, search for events by name, and view the list of events below.

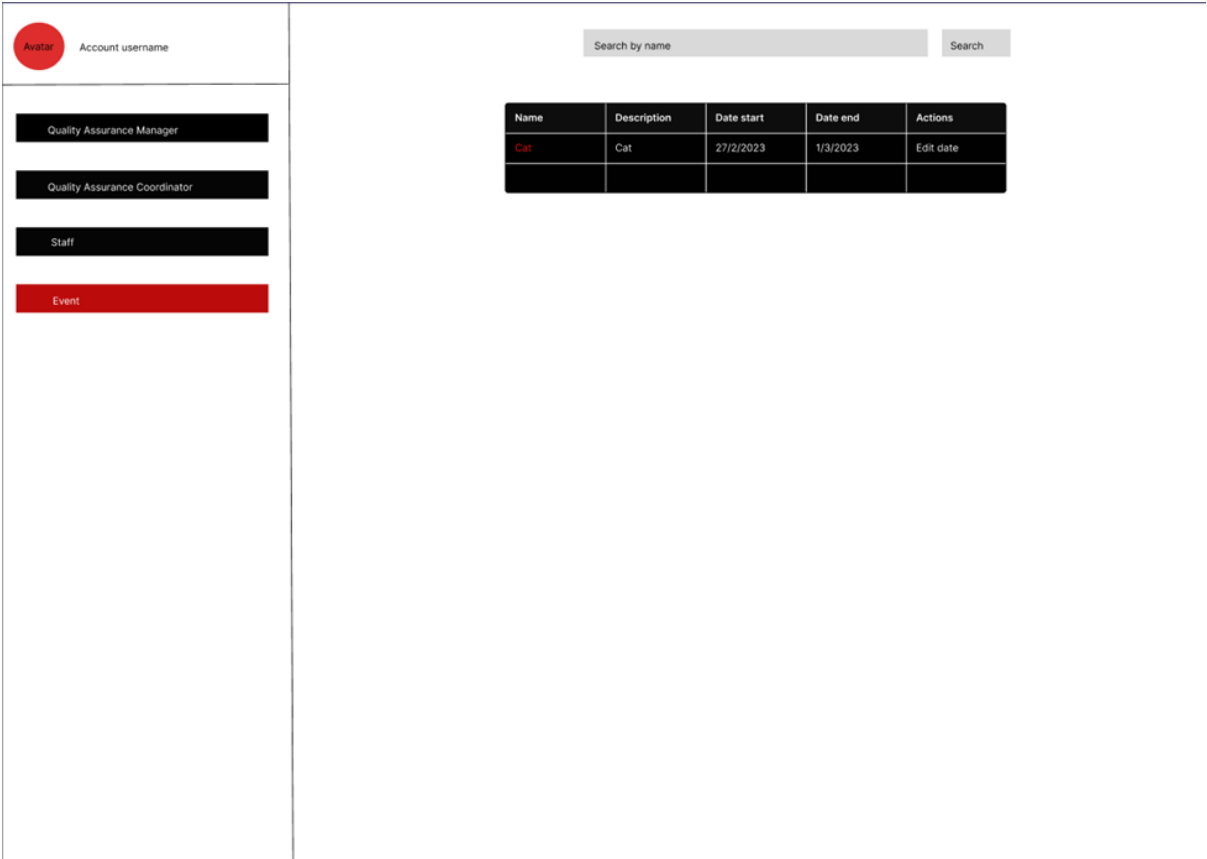

Figure 38: Wireframe event page

Details event page

Details of this event are given on this page.

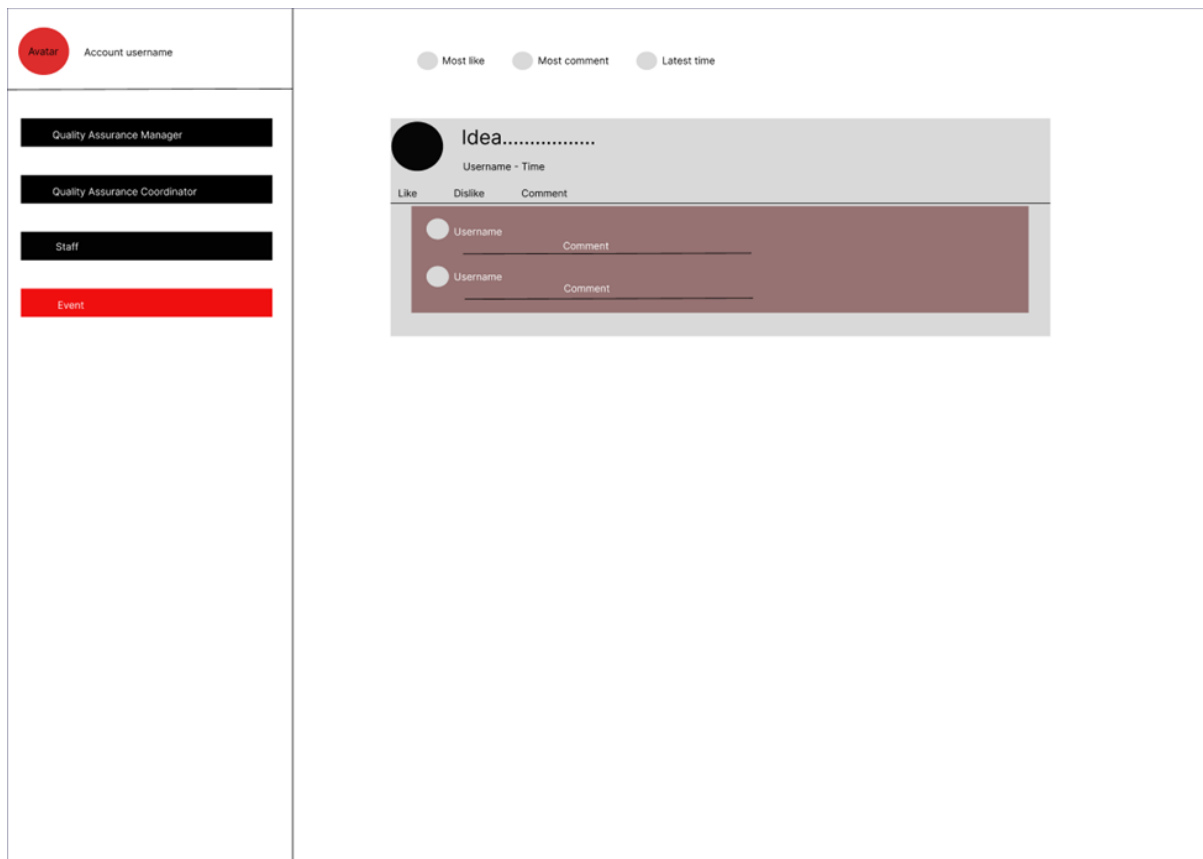

Figure 39: Wireframe Details event page

Add new event page

This page enables the administrator to update event information.

The wireframe shows a two-column layout. The left column is a sidebar with a white background. At the top, it features a red circular avatar placeholder and the text 'Account username'. Below this is a list of roles, each in a black rectangular button: 'Quality Assurance Manager', 'Quality Assurance Coordinator', 'Staff', and 'Event'. The 'Event' button is highlighted in red. The right column is the main content area, which contains a large yellow rectangular box. Inside this box, there are four form fields: 'Name' (a single-line text input), 'Date start' and 'Date end' (two single-line date inputs), and 'Description' (a multi-line text area). A 'Save' button is located at the bottom right of the yellow box.

c) Flowchart

Flowchart for adding accounts.

The administrator must provide data, such as a username, password, email address, etc., to create a new account. After that, the system will determine whether or not the newly generated account information is already in the system. A warning will be displayed if the freshly created data has already been recorded. New account information entered will be stored in the database.

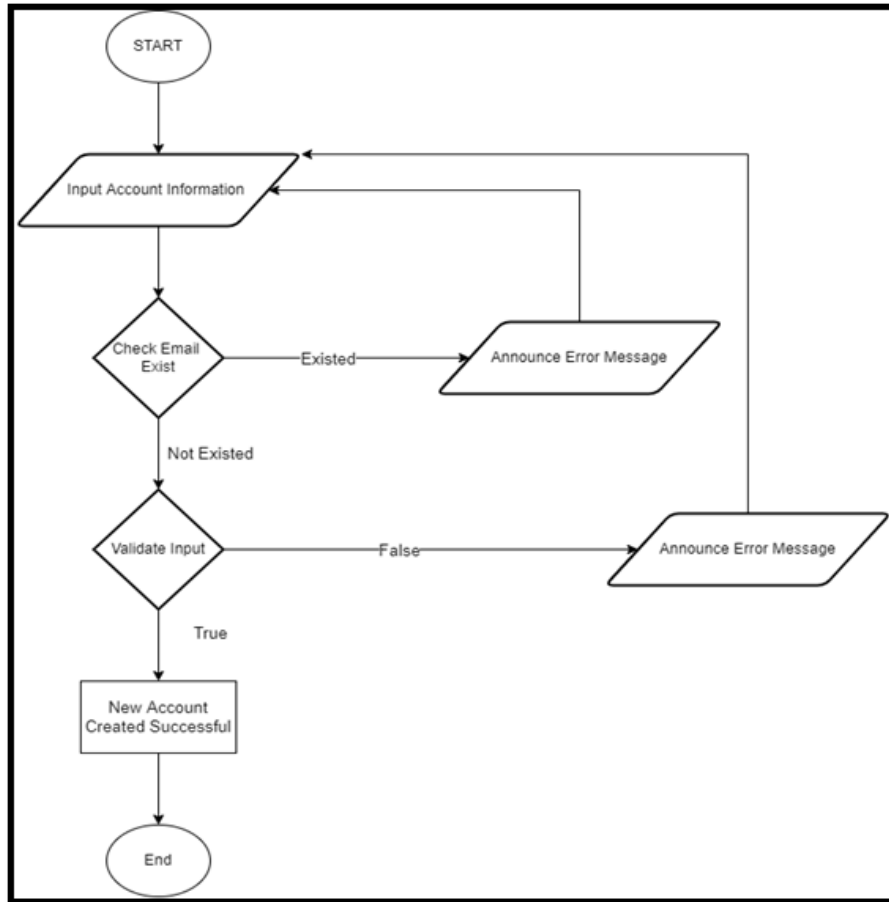

Figure 49: Flowchart for adding accounts

Flowchart for updates Account.

Using the edit information of account function, the admin will choose the account to edit and enter new information; if the information has already been entered and needs to be repeated, the admin must do so; if the information is entirely accurate, the account's data will be successfully changed in the database.

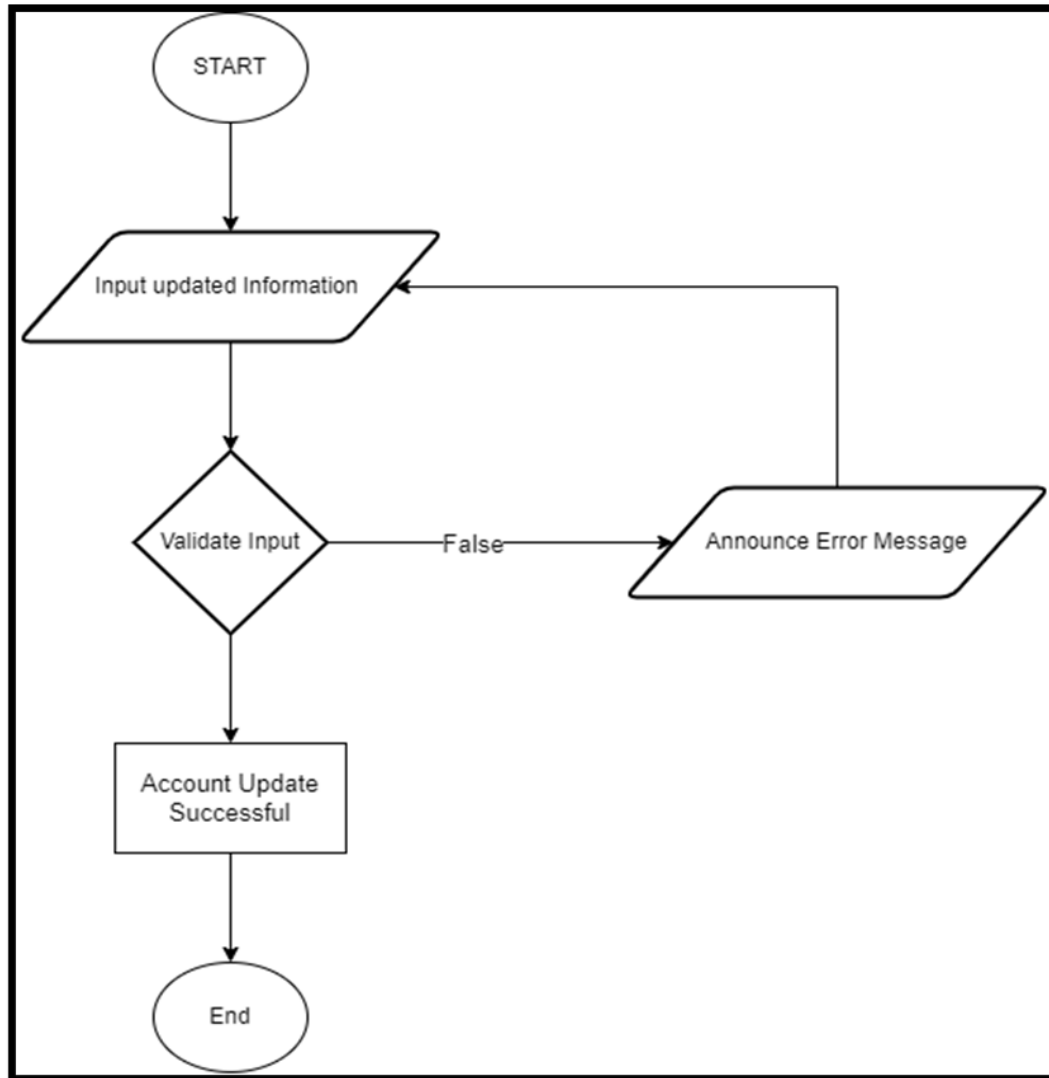

Figure 50: Flowchart for updates Account

Flowchart for delete Account.

With the delete account function, the administrator chooses the account to delete, receives a confirmation message from the system, and then selects "yes" to confirm the deletion of the data from the database.

Figure 51: Flowchart for delete Account

Login page

To log in, the user must enter the username and password that the administrator has already set. If the necessary login information is given, the system will automatically assign the user to their appropriate role; if not, a notification will be displayed and the user will need to check in to the appropriate account.

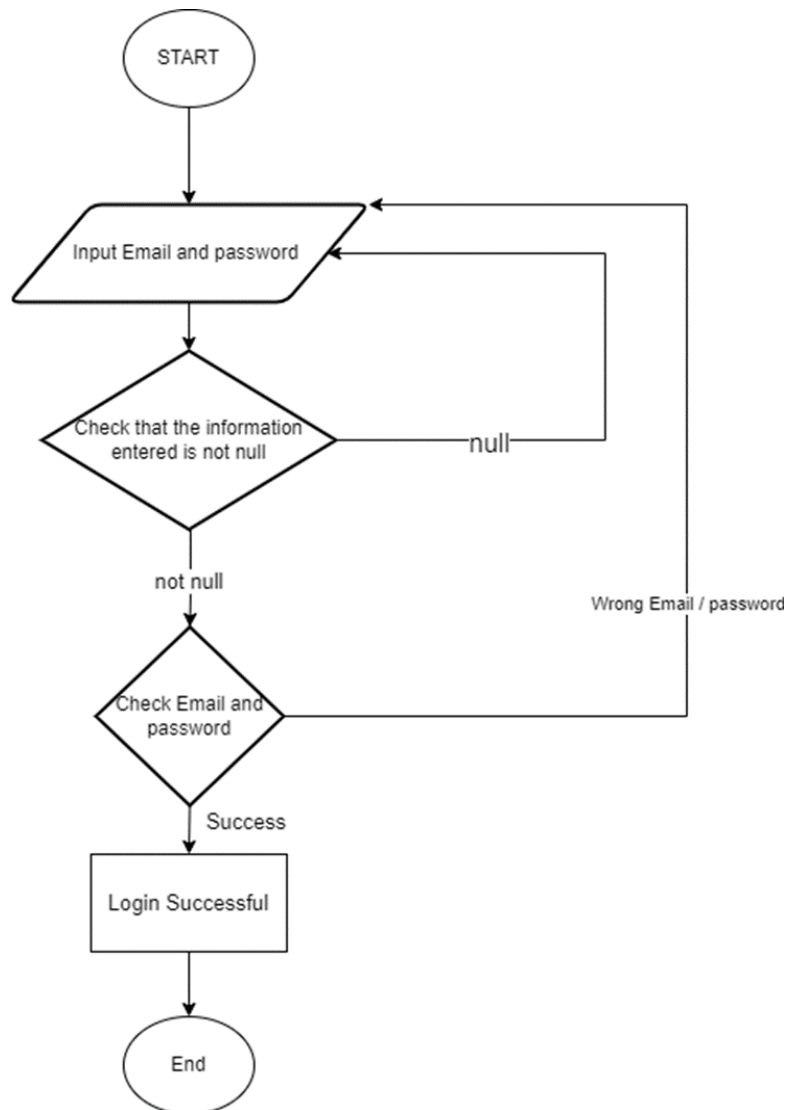

Figure 52: Login page

Add new category

The assurance manager must provide the category name in order to create a new category. The system will then determine whether or not the newly added category information is already there. A warning will be displayed if the freshly created data has already been recorded. The database will be stored with the information entered for a new category.

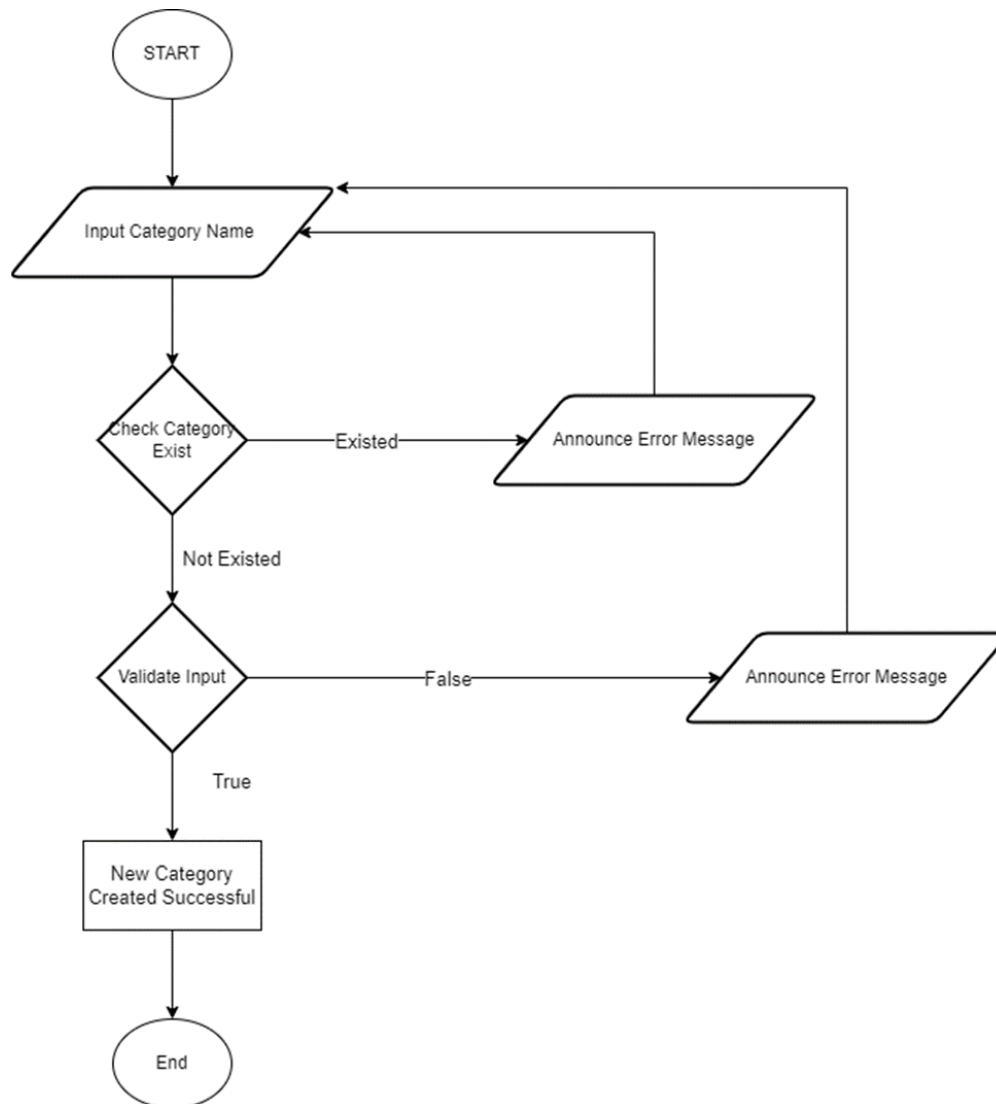

Figure 53: Add new category

Delete category

When using the delete category function, the assurance manager chooses the category to remove, receives a confirmation message from the system, and selects "yes" to confirm the deletion of the data from the database.

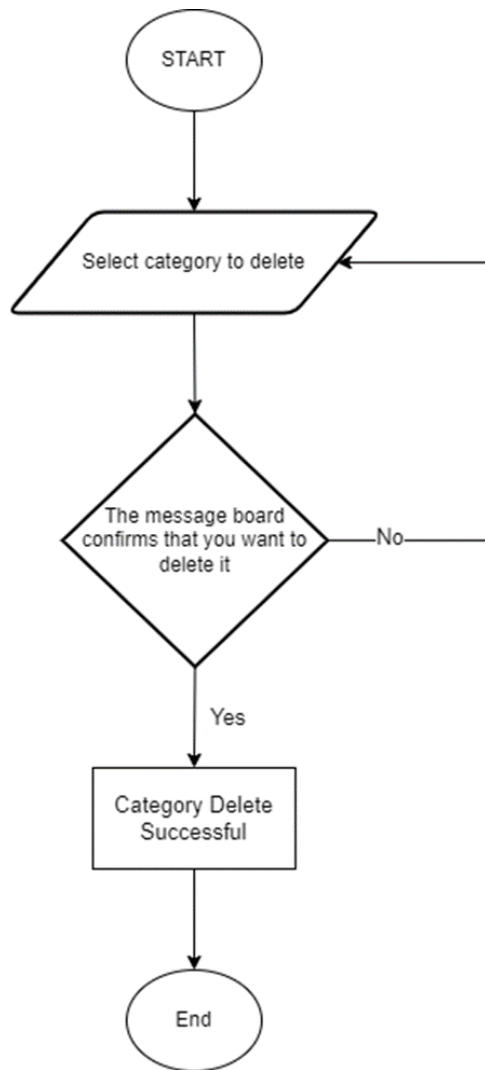

Figure 54: Delete category

Download zip and csv

The user can choose a category and download a zip or csv file containing that category's information.

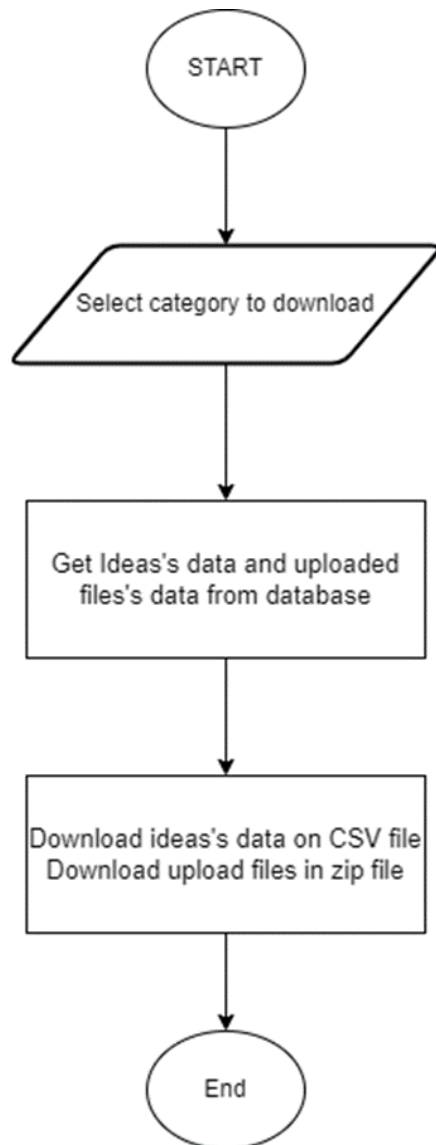

Figure 55: Download zip and csv

Flowchart of liking idea.

The system checks whether the user has liked or disliked the post when the user clicks the like button. If the user has liked the post, the system will send a notification; if the user has disliked it, the system will change dislike to like.

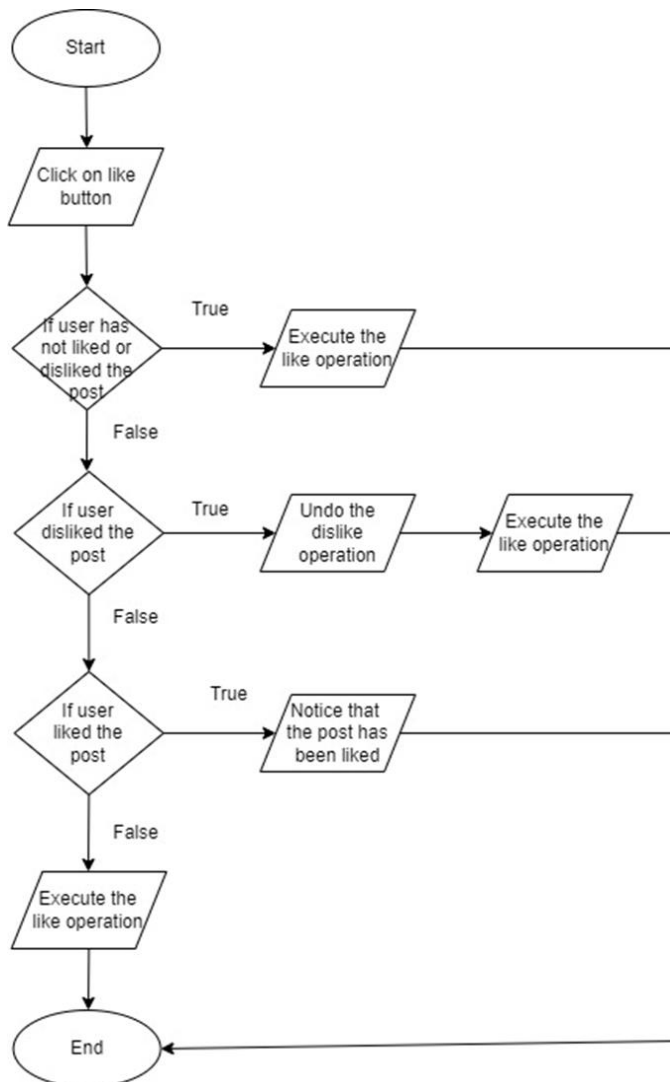

Figure 56: Flowchart of liking idea.

Flowchart of disliking idea

When a user clicks the dislike button, the system checks to see if the user has liked or disliked that particular post; if not, the user disliked it successfully; if the user disliked the post, the system will send a notification; if the user has liked that particular post, the system will remove the like and change the status to dislike.

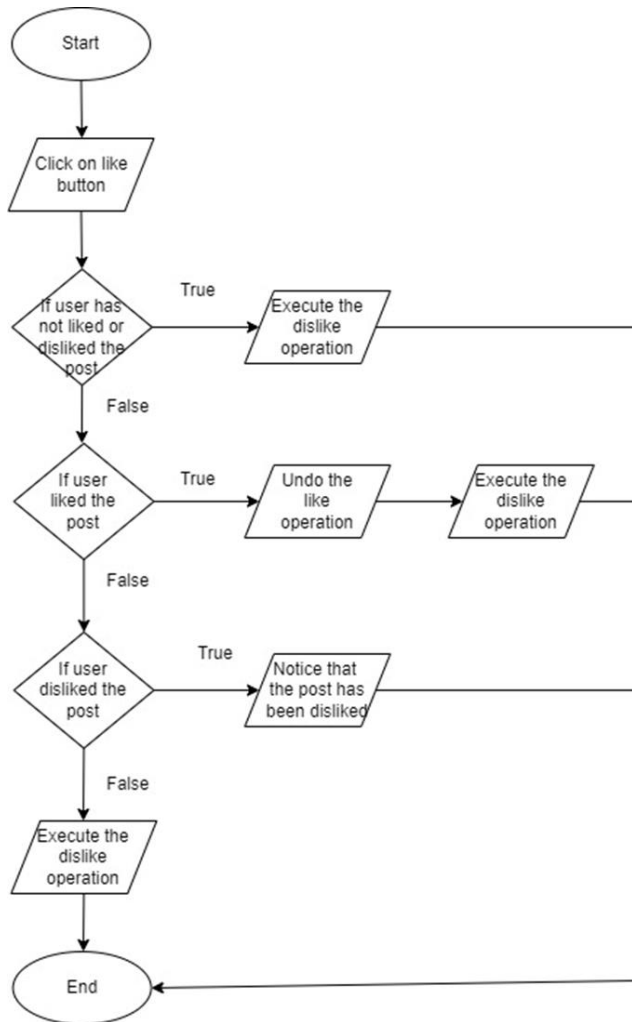

Figure 57: Flowchart of disliking idea

Flowchart for posting idea

The employee must attach a word or pdf file before selecting a date while utilizing the "updating ideas" feature. A failure message will show up if the date they select has already passed. If the staff member decides to publish anonymously or using their current name, the idea will then be added to the database; otherwise, they won't be able to.

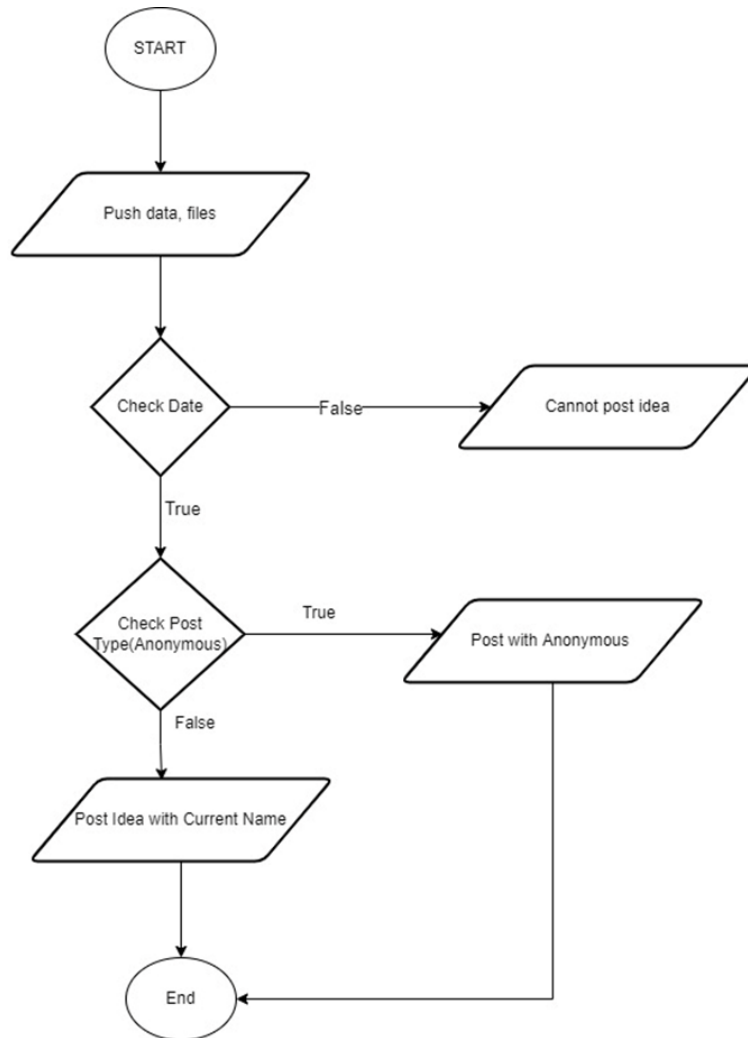

Figure 58: Flowchart for posting idea

Flowchart for comment

The employee must enter a comment into the box before using the "comment" function. The comment will be published unless the staff member chooses to post anonymously or using their real name.

2. Reflection on my own performance

As a front-end team member in an agile project, I played a critical role in creating flowcharts, sitemaps, and wireframes to visualize the system and ensure that all team members were aligned with project goals. My attention to detail and willingness to make changes contributed to a seamless user experience and a final product that met the client's needs. To improve, I plan to develop my agile methodology skills and communication with team members and stakeholders. Overall, my dedication and high-quality work were essential to the project's success, and I aim to continue improving my skills and adaptability in future projects.

3. Lessons learnt

Some potential lessons learned from the project could include:

- Collaboration and communication are key to success in an agile team. It's important to have open lines of communication and regular check-ins to ensure that everyone is on the same page and working towards the same goals.
- Clear visualization of the system through flowcharts, sitemaps, and wireframes can help ensure that everyone has a shared understanding of the project's objectives and goals.
- Attention to detail is crucial, especially in the front-end development phase, to ensure that the final product is functional and aesthetically pleasing.
- The ability to adapt quickly to changes in project requirements is essential in an agile team, and being willing to make changes as needed can help ensure that the project stays on track and meets the client's needs.
